"Attempts to prevent rice blast (brusone)." Imre Prettenhoffer, Ferenc Somorjai, and Lajos Kertész (Research Inst. Irrigation and Reclamation, Szeged). *Agrokémia és Talajtan* 1, 211-34(1951).—Investigations carried out in plots where rice blast frequently occurred proved that this disease (which manifests itself in the browning of the plant) is caused by a complex of factors. Prevention must predominantly consist in eliminating reduction processes in the soils flooded. In the case of alkali soils examd., only the reclamation with the yellow calcareous subsoil proved successful. Liming with lime from sugar factories reduced the detrimental processes in soil but did not completely prevent the outbreak of disease. I. F.

April 1954
Agriculture and Horticulture.

Results of cauliflower spacing trials. A. Soos (*Növénytermelés*, 1953, 2, 165– 69).—Experiments show that the most advantageous spacing for the variety " Dwarf of Erfurt " is 40 and 50 cm. between the rows and the individual plants, respectively. Closer spacing results in lower average wt. of heads. The consumable " heads of flowers " amount to 24—26 wt.-% of the total crop. Modification of spacing does not influence appreciably this proportion.

Distribution of Wassermann reagin among the protein fractions of blood serum. István Kähler, Éle Somos, and István Rácz. *Orvosi Hetilap* 80, 325 S. [1936]. All the reagin is found in the albumin and the globulin fractions. The content in total protein and in globulin were determined before and after dialysis. The protein remaining after dialysis seemed to be not quite pure albumin. In the serum of 17 syphilis patients the reagin was found in the albumin fraction and the globulin fraction in the ratio of 1:11.3:8

The orgin of an autohaemolysis of long duration (called by the authors biological autohaemolysis') is always syphilitic. Transitory autohaemolysis may occur in non-syphilitics. The titre of autohaemolysis is always low, that of the reacting agent (reagin) may be high. The substance which participates in the autohaemolysis is contained in the blobulin fraction. Artificial autohaemolysis can only be produced in sera of persons inclined to such changes.

51 The Skipin process for extracting vegetable oils and experiences obtained in laboratory experiments, by Gy. Somos and I. Dancsecs (Mezogazdasagi Ipar Agricultural Industry Vol IV No 9, pp 20-29 Sept 1950)

After making known the data contained in the trade literature pertaining to the Skipin process, the authors give a description of the experiences obtained in the course of laboratory experiments investigations performed in test tubes of 4 cm diam provided with the aim of oil output was decisively influenced by the manner of filling the charge of the apparatus and the treatment of the material. Further experiments made with pressed sunflower seeds were performed in a cylindrical container 4 to 10 cm in diam. It was established that the oil output depends, to a large extent upon the quantity of raw material processed at one time. It appeared that a moisture content of 10 per cent proved most suitable with the apparatus used. The fineness of grinding influenced the oil output considerably. Excessive fineness in grinding resulted in a reduced output. Further experiments were designed to establish the best suited [illegible] preserving the various [illegible] ity of oil produced and the effect of the [illegible] condition on the quality of the oil [illegible] trade literature are given.

3688. Characteristics of selenium rectifiers under static and under operating conditions. I. Somos. *Elektrotechnika*, 48, 154–9 (May, 1954) In Hungarian.

Metering values obtained for selenium rectifiers are influenced by a number of factors which render them frequently unreliable; the data usually supplied do not enable a clear picture of the operating conditions to be obtained of the individual rectifier elements. Methods of [redacted] are described which provide reproducible results under conditions closely resembling normal operating conditions. Measurements were carried out for both directions of the current flow in circuits in which the feed current was d.c., rectified a.c. and a.c. The results obtained using the various circuits are compared in graphs, which are included. E. GROS

59 **Special qualities of selenium rectifiers.** I. Somos. *Elektrotechnika* Vol 48, 1955, No. 8, pp 289–299, 20 figs

Due to the dynamic qualities of selenium rectifiers their characteristics undergo slow reversible changes. In some extreme cases the slow dynamic changes convert into slow static changes e.g. creep. The slow dynamic changes occur when reverse reaches the permissible value or when the shape of the reverse voltage curve differs from that of the forming voltage applied in the course of manufacture. The forward dynamic voltage drop of selenium rectifiers differs from the static voltage drop since forward resistance increases due to reverse. 20 volts exercises the strongest influence. In the static state the effect ceases in 2 to 3 seconds but it remains constant during the operation of the rectifier. The dynamic value of reverse current differs from the static value as well. Ageing of selenium rectifiers depends on the temp and electric loads its course may be illustrated in a time graph

Orig Pub: Gyogyszeresz, 1956, 11, No 1, 10-11.

Abstract: Freshly distilled water exhibits after 48 hours of storage pyrogenic properties which persist on storage for two years (freshly distilled water, well water and mineral water are not pyrogenic). After filtration through special filters the water loses its pyrogenic properties, but the latter are rapidly restored on subsequent storage.

Title : Biological Determination and Explanation for the Presence of Melanophoric Hormone in ACTH Preparations

Orig Pub : Acta pharmac. hung., 1957, 27, No 1-2, 62-65

Abstract : ACTH preparations, developed by various methods, act differently on the melanocytes and on the ascorbic acid concentration of the adrenals. ACTH and melanophoric hormone reveal different degrees of stability when treated with alkalines, ACTH being destroyed in this process. Upon introduction of the melanophoric hormone, the amount of ascorbic acid in the adrenals is not changed and there is no hypertrophy of the adrenals. -- Ya. Dzvon'ar

TITLE: Diffusion reactions in the Mo-Si, W-Si and Ta-Si systems

PERIODICAL: Fizika metallov i metallovedeniye, v.13, no.1, 1962, 77-81

TEXT: The processes occurring during the saturation of molybdenum, tungsten and tantalum by silicon on thermal diffusion were studied. Metallic samples were heated in silicon powder in a vacuum of 10^{-5} mm mercury in the range 1150-1350°C. The silicide layer, formed on the surface of the metals, was examined by metallographic and X-ray analysis. The results showed that the saturated layer was produced, in the main, through the vapour phase. The first stage was the formation of lower silicides. Afterwards, higher silicides are formed. At 1240°C, the disilicide appears after 0.5, 1 and 3 hours on W, Ta and Mo, respectively. Once the disilicide has appeared, further growth occurs largely by this phase, and only after a definite thickness has been attained is there a retardation in growth of disilicide

and increased growth in the layers of lower silicide. It was shown from X-ray analysis and from the change in form of the samples during diffusion that preferential diffusion of silicon through the silicide layer occurred, and the reaction leading to the formation of the phase takes place mainly at the internal boundary of the layer. TITLE: The kinetics of vacuum siliciding

PERIODICAL: Zhurnal prikladnoy khimii, v. 35, no. 9, 1962, 1960 - 1964

TEXT: The above problem was studied theoretically and experimentally in view of the advantages of this process and high quality of the resultant coatings. By considering a vapor interacting with a solid to form a layer of product upon the latter, which is of thickness l after a time t, and assuming that the vapor is supplied into the reaction zone at a rate much lower than the rate of mutual diffusion of reactants through the layer formed, it is shown on general grounds that l should vary linearly with t. The relation between l and t becomes parabolic if the rate of chemisorption of the vapor upon the solid surface is higher than the rate of diffusion through the layer. To confirm these results 10 x 10 x 1.5 mm specimens of Ta and Mo were silicided by a method similar to that described by Gorbunov, using Si powder (0.5 - 1.0 mm), at 1200, 1250, 1300 and

The kinetics of vacuum siliciding

1350°C. Linear growth of the silicided layers with time was observed on both metals at 1200 and 1250°C, for coatings 50 - 150 μ thick. For thicker (~180 - 250 μ) coatings and at higher temperatures, the layer thickness increased parabolically with time. It is thus concluded that the rate of formation of thin layers of $MoSi_2$ and $TaSi_2$ at 1200 and 1250°C is governed by the rate of chemisorption of Si vapor and not by diffusion through the disilicides. There are 3 figures and 1 table.

TITLE: Growing corundum single crystals by Czochralski technique in vacuum

SOURCE: AN SSSR. Izvestiya. Neorganicheskiye materialy, v. 1, no. 7, 1965, 1049-1050

TOPIC TAGS: corundum, aluminum oxide, alumina, aluminum compound, single crystal, single crystal growth, single crystal growing, crystallization, etched crystal, crystal dislocation, corundum single crystal, melt crystallization, Czochralski technique, crystal dislocation structure

ABSTRACT: The Czochralski technique has been applied to grow corundum single crystals more perfect than crystals grown by other techniques (Verneuil, hydrothermal, fluxed melt). The starting material, aluminum oxide powder in briquet form, was sintered and smelted to

Card 1/2

minimize the gas evolution at the start of crystal pulling operation. The ingots were remelted in tungsten crucibles in vacuum and the crystals were pulled at the optimum rate of 1.5 cm/hr. Dislocation structure of the crystals was studied by x-ray and micrographic methods. The average density of dislocations (etch pits) on the (0001) plane was found to be two orders of magnitude lower than in the crystals grown by the Verneuil technique. The slip lines observed on the (0001) plane presumably were developed in the process of cooling. Orig. art. has: 2 figures. [JK]

TITLE: Preparation of corundum single crystals by electron-beam zone melting 15

SOURCE: AN SSSR. Izvestiya. Neorganicheskiye materialy, v. 2, no. 10, 1966, 1892-1894

TOPIC TAGS: single crystal growth, corundum, alumina, zone melting, electron beam melting, electron gun

ABSTRACT: Corundum single crystals have been grown by electron-beam float-zone melting of sintered alumina rods, with or without seed, using an improved electron

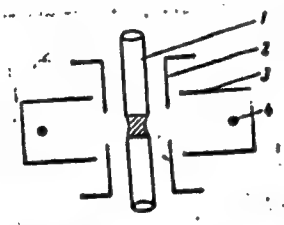

Fig. 1. Electron gun heater

TITLE: Mirror antenna feed. Class 21, No. 187099

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 20, 1966, 60

TOPIC TAGS: Antenna, antenna feed, antenna radiation pattern

ABSTRACT: This Author Certificate introduces a feed for a mirror reflecting antenna. The feed is constructed in the form of a sectional or pyramidal horn with two parallel conductive plates fixed along two opposed horn walls. In order to extend the excitation of reflector edges and thereby to improve the effectiveness of widening the antenna's radiation pattern, these plates are placed such that the distance between them at the free end of the horn is smaller than at the horn opening.
